Buuren, Stef van (2018). *Flexible imputation of missing data*. eng. Second edition. International and comparative criminal justice series. Boca Raton, FL: Chapman, Hall/CRC, an imprint of Taylor, and Francis. ISBN: 0-429-96035-2

. Missing data pose challenges to real-life data analysis. Simple ad-hoc fixes, like deletion or mean imputation, only work under highly restrictive conditions, which are often not met in practice. Multiple imputation replaces each missing value by multiple plausible values. The variability between these replacements reflects our ignorance of the true (but missing) value. Each of the completed data set is then analyzed by standard methods, and the results are pooled to obtain unbiased estimates with correct confidence intervals. Multiple imputation is a general approach that also inspires novel solutions to old problems by reformulating the task at hand as a missing-data problem. This is the second edition of a popular book on multiple imputation, focused on explaining the application of methods through detailed worked examples using the MICE package as developed by the author. This new edition incorporates the recent developments in this fast-moving field. This class-tested book avoids mathematical and technical details as much as possible: formulas are accompanied by verbal statements that explain the formula in accessible terms. The book sharpens the reader's intuition on how to think about missing data, and provides all the tools needed to execute a well-grounded quantitative analysis in the presence of missing data.

Cheshire, Paul and Stephen Sheppard (2002). "The welfare economics of land use planning". eng. In: *Journal of urban economics* 52.2, pp. 242–269. ISSN: 0094-1190

. This paper presents an empirical methodology for the evaluation of the benefits and costs of land use planning. The technique is applied in the context of the Town and Country Planning System of the UK, and examines the gross and net benefits of land use regulation and their distribution across income groups. The results show that the welfare and distributional impacts can be large.

Cho, Seong-Hoon et al. (2009). "Spatial and temporal variation in the housing market values of lot size and open space". eng. In: *Land economics* 85.1, pp. 51–73. ISSN: 0023-7639

. This research analyzes spatial and temporal variation in the effects of lot size and proximity to open space on residential home values in a single Tennessee county. The findings show that the value of proximity to greenways, parks, and water bodies increased over time, while the value of lot size and proximity to golf courses fell. Proximity to open space is found to be a substitute for lot size, although the degree of substitutability has weakened over time. Geographic variation in the marginal effects of lot size and proximity to open space is analyzed using locally weighted regression analysis. (JEL C31, Q51)

Coase, R. H. (2013). "The Problem of Social Cost". eng. In: *The Journal of law & economics* 56.4, pp. 837–877. ISSN: 0022-2186

. This paper is concerned with those actions of business firms which have harmful effects on others. The standard example is that of a factory the smoke from which has harmful effects on those occupying neighbouring properties. The economic analysis of such a situation has usually proceeded in terms of a divergence between the private and social product of the factory, in which economists have largely followed the treatment of Pigou in *The Economics of Welfare*. The conclusions to which this kind of analysis seems to have led most economists is that it would be desirable to make the owner of the factory liable for the damage caused to those

- injured by the smoke, or alternatively, to place a tax on the factory owner varying with the amount of smoke produced and equivalent in money terms to the damage it would cause, or finally, to exclude the factory from residential districts.
- Davis, Morris A., William D. Larson, et al. (2021). “The price of residential land for counties, ZIP codes, and census tracts in the United States”. eng. In: *Journal of monetary economics* 118, pp. 413–431. ISSN: 0304-3932
- We estimate land prices for many US counties, ZIP codes, and census tracts.
 - Our estimates cover the vast majority of the U.S. population.
 - Land at the city center is far pricier for large metros than small metros.
 - Land prices follow predictions of classic models of urban economics.
 - The land-price data we estimate are available for free download. Data from millions of appraisals in 2012–2019 are used to estimate residential land prices, the share of house value attributable to land, and related statistics down to the census-tract level for areas that include the vast majority of U.S. population and single-family housing. The results confirm predictions about land prices from canonical urban models. Over 2012–2019, we show that land prices rose faster than house prices in large metro areas, boosting the land share of house value, while the land share fell in smaller metros. The data are available for download at <https://www.fhfa.gov/papers/wp1901.aspx>.
- Davis, Morris A. and Michael G. Palumbo (2008). “The price of residential land in large US cities”. eng. In: *Journal of urban economics* 63.1, pp. 352–384. ISSN: 0094-1190
- Combining data from several sources, we build a database of home values, the cost of housing structures, and residential land values for 46 large US metropolitan areas from 1984 to 2004. Our analysis of these new data reveal that since the mid-1980s residential land values have appreciated over a much wider range of cities than is commonly believed. And, since 1998, almost all large US cities have seen significant increases in real residential land prices. Averaging across the cities in our sample, by year-end 2004, the value of residential land accounted for about 50 percent of the total market value of housing, up from 32 percent in 1984. An implication of our results is that housing is much more land intensive than it used to be, meaning that the future course of home prices—the average rate of appreciation and volatility—is likely to be determined even more by demand factors than was the case even ten or twenty years ago.
- Del Negro, Marco and Christopher Otrok (2007). “99 Luftballons: Monetary policy and the house price boom across U.S. states”. eng. In: *Journal of monetary economics* 54.7, pp. 1962–1985. ISSN: 0304-3932
- We use a dynamic factor model estimated on quarterly state-level data from 1986 to 2005 via Bayesian methods to disentangle the relative importance of the common component in OFHEO house price movements from local (state- or region-specific) shocks. We find that historically movements in house prices were mainly driven by the local component. The recent period (2001-2005) has been different: the increase in house prices is a national phenomenon. We use a VAR to investigate the extent to which expansionary monetary policy is responsible for this phenomenon. We find the impact of policy shocks on house prices to be small in comparison with the magnitude of recent fluctuations.
- Ellickson, Robert C (2022). “STALE REAL ESTATE COVENANTS”. eng. In: *William and Mary law review* 63.6, pp. 1831–. ISSN: 0043-5589
- Since the 1970s, covenants running with the land have tethered a large majority of the new housing units produced in the United States. These private restraints usually continue for generations, until a majority or supermajority of covenant beneficiaries affirmatively vote to amend or terminate them. Covenants interact with public land use controls, particularly zoning ordinances. Zoning politics tends to freeze land uses in urban America, particularly in existing neighborhoods of single-family homes. This Article investigates to what extent covenants exacerbate the zoning freeze. It provides a history of the use of private covenants and suggests how drafters, judges, and legislators might address the risk that covenants will become obsolete.

Fischel, William A. (2015). *Zoning rules! : the economics of land use regulation*. eng. 1st ed. Cambridge, Massachusetts: Lincoln Institute of Land Policy. ISBN: 1-55844-329-0

. This best-selling book describes how zoning has been overused by local communities to block new housing development in ways that exacerbate sprawl and social inequity. It lays out the history, motivation, structure, and impact of municipal zoning in the United States and offers more effective approaches for developers and public officials to consider when instituting new regulations.

Glaeser, Edward L., Joseph Gyourko, and Raven Saks (2005). “Why Is Manhattan So Expensive? Regulation and the Rise in Housing Prices”. eng. In: *The Journal of law & economics* 48.2, pp. 331–369. ISSN: 0022-2186

. In Manhattan, housing prices have soared since the 1990s. Although rising incomes, lower interest rates, and other factors can explain the demand side of this increase, some sluggishness in the supply of apartment buildings is needed to account for high and rising prices. In a market dominated by high-rises, the marginal cost of supplying more housing is the cost of adding an extra floor to any new building. Home building is a highly competitive industry with almost no natural barriers to entry, and yet prices in Manhattan currently appear to be more than twice their supply costs. We argue that land use restrictions are the natural explanation for this gap. We also present evidence that regulation is constraining the supply of housing in a number of other housing markets across the country. In these areas, increases in demand have led not to more housing units but to higher prices.

Glaeser, Edward., National Bureau of Economic Research., and Joseph. Gyourko (2017). *The Economic Implications of Housing Supply*. eng. NBER working paper series no. w23833. Cambridge, Mass: National Bureau of Economic Research

. In this essay, we review the basic economics of housing supply and the functioning of US housing markets to better understand the distribution of home prices, household wealth and the spatial distribution of people across markets. We employ a cost-based approach to gauge whether a housing market is delivering appropriately priced units. Specifically, we investigate whether market prices (roughly) equal the costs of producing the housing unit. If so, the market is well-functioning in the sense that it efficiently delivers housing units at their production cost. Of course, poorer households still may have very high housing cost burdens that society may wish to address via transfers. But if housing prices are above this cost in a given area, then the housing market is not functioning well— and housing is too expensive for all households in the market, not just for poorer ones. The gap between price and production cost can be understood as a regulatory tax, which might be efficiently incorporating the negative externalities of new production, but typical estimates find that the implicit tax is far higher than most reasonable estimates of those externalities.

Gyourko, Joseph., National Bureau of Economic Research., and Jacob. Krimmel (2021). *The Impact of Local Residential Land Use Restrictions on Land Values Across and Within Single Family Housing Markets*. eng. NBER working paper series no. w28993. Cambridge, Mass: National Bureau of Economic Research

. We provide estimates of the impact of restrictive residential land use environments on the price of land across major American housing markets. Using micro data on vacant land purchased to develop single family housing, we implement a new empirical strategy for estimating so-called ‘zoning taxes’ - the amount by which land prices are bid up due to supply side regulations. Our results are broadly consistent with previous findings that zoning taxes are especially burdensome in large coastal markets. However, our more recent data indicates that price impacts in the big west coast markets now are the largest in the nation. In the San Francisco, Los Angeles, and Seattle metropolitan areas, the price of land everywhere within those three markets having been bid up by amounts that at least equal typical household income. Finally, we show that our zoning tax estimates are strongly positively correlated with a new measure of local housing market supply constraint (the Wharton Residential Land Use Regulatory Index of 2018). This

- relationship is not mechanically driven as the regulatory index is constructed from survey data that do not incorporate land or house price data in any way.
- Korngold, Gerald (2024). "Repealing Single-Family Zoning Is Not Enough: A Proposal For Removing Existing Parallel Private Covenants For Violating Public Policy". eng. In: *Missouri law review* 89.1, pp. 1–. ISSN: 0026-6604
- . The United States is currently suffering a pervasive and unsettling shortage of housing and increased housing unaffordability. Rents are at an all-time high, which has a disproportionate impact on people of color and people earning lower incomes as these individuals are more likely to rent rather than own their homes. Moreover, people solidly in the middle class are finding it increasingly difficult to purchase residences within their budgets.
- Limehouse, Frank F, Robert E McCormick, and Melissa M Yeoh (2012). "The private provision of public goods: an analysis of homes on golf courses". eng. In: *The Journal of private enterprise* 27.2, pp. 103–120. ISSN: 0890-913X
- . This paper examines the joint production of golf and real estate development. The empirical results of this analysis show that, over time, golf courses are being constructed less for recreational golf and more for contractual assurance of green open space for homes. We believe that this fundamentally provides some evidence that the demand for environmental quality is growing and that markets are increasingly able to find creative contracting mechanisms to satisfy demands for public goods.
- Limehouse, Frank F., Peter C. Melvin, and Robert E. McCormick (2010). "The Demand for Environmental Quality: An Application of Hedonic Pricing in Golf". eng. In: *Journal of sports economics* 11.3, pp. 261–286. ISSN: 1527-0025
- . The analysis uses an exhaustive golf course database that contains over 100 golf course variables on more than 15,000 golf courses in the United States combined with data from the Audubon International Cooperative Sanctuary Program to examine the market setting of environmental certification on golf courses. Using the Rosen (1974) two-stage estimation technique, quality-adjusted structural demand and supply equations for golf are estimated. A standard hedonic pricing model shows a substantial price premium for environmentally certified Audubon International golf courses. Additional results suggest that the increase in marginal benefits of certification is approximately equal to the increase in marginal costs.
- Meisenholder, Haley C (2019). *Not in My Back Nine: An Examination of Land Use Disputes Over Golf Course Redevelopments in America*. eng
- . Golf courses in America delineate and identify landscapes of luxury, exclusion and abundance. Golf courses in the Southwest are part of an invented tradition and the product of land speculation occurring after post-World War II suburbanization. Golf courses were built within master planned suburbs to inflate property values and to sell a middle-class cultural standing. Following the tradition of the exclusive country club, these new housing subdivisions sought to provide access to a new social network or identifier. In the Southwest, the amount of resources needed to create the lushness of the course is in stark contrast with reality the desolate natural landscape. Since 2000, golf has seen a decline with decreases in membership and a change in middle-class values no longer upholding the sport. Over 1,000 golf courses have closed over the last decade, opening up over 190,000 acres potentially for a new use. With many of these courses considered community amenities, homeowners are fighting redevelopment efforts happening in their backyards. Through interviews, site visits, archival and media research, three exclusionary tactics are identified in three case in the Southwest. One case argues the golf course use is mandatory for the open space requirement of the master planned community. Ecologically, courses within the Southwest require more water than other courses in America. Legal requirements, like CC&Rs, are used to keep the golf use in perpetuity, no matter its economic success. Without legal backing, homeowners may use their social and political clout to demand the use remain in the community. Through these mechanisms, the invented tradition upholding this exclusionary use is continued. Communities fear a change in use will decrease their property values and bring new unknown neighbors. Each of these communities independently is deciding the "highest and

- best" use of the newly vacant land. As courses continue to close across the United States, the future uses and impacts of these conversions remains unknown.
- Rosen, Sherwin (1974). "Hedonic Prices and Implicit Markets: Product Differentiation in Pure Competition". eng. In: *The Journal of political economy* 82.1, pp. 34–55. ISSN: 0022-3808
- . A CLASS OF DIFFERENTIATED PRODUCTS IS COMPLETELY DESCRIBED BY A VECTOR OF OBJECTIVELY MEASURED CHARACTERISTICS. OBSERVED PRODUCT PRICES AND THE SPECIFIC AMOUNTS OF CHARACTERISTICS ASSOCIATED WITH EACH GOOD DEFINE A SET OF IMPLICIT OR 'HEDONIC' PRICES. A THEORY OF HEDONIC PRICES IS FORMULATED AS A PROBLEM IN THE ECONOMICS OF SPATIAL EQUILIBRIUM IN WHICH THE ENTIRE SET OF IMPLICIT PRICES GUIDES BOTH CONSUMER AND PRODUCER LOCATIONAL MEANING AND NATURE OF MARKET EQUILIBRIUM, ARE ANALYZED. EMPIRICAL IMPLICATIONS FOR HEDONIC PRICE REGRESSIONS AND INDEX NUMBER CONSTRUCTION ARE POINTED OUT.

- Weinand, Jann Michael et al. (2025). "Countries across the world use more land for golf courses than wind or solar energy". eng. In: *Environmental Research Communications* 7.2, pp. 21012–. ISSN: 2515-7620
- . Land use is a critical factor in the siting of renewable energy facilities and is often scrutinized due to perceived conflicts with other land demands. Meanwhile, substantial areas are devoted to activities such as golf, which are accessible to only a select few and have a significant land and environmental footprint. Our study shows that in countries such as the United States and the United Kingdom, far more land is allocated to golf courses than to renewable energy facilities. Areas equivalent to those currently used for golf could support the installation of up to 842 GW of solar and 659 GW of wind capacity in the top ten countries with the most golf courses. In many of these countries, this potential exceeds both current installed capacity and medium-term projections. These findings underscore the untapped potential of rethinking land use priorities to accelerate the transition to renewable energy.
